

Federated Windows Domain SSO

CHALLENGE

Building partner networks is crucial in today's competitive corporate landscape. Companies that can offer flexible on-line access to the required resources 24/7 can create competitive advantages to their rivals.

It is always difficult to grant access to outsiders. By allowing the partner into your network, you are placing trust to the other organization and their employees. But to ensure survival, companies may be forced to do so.

The content that you provide to your partners may be accessible through an application server (J2EE or .NET), Web

server or an integrated collaboration platform such as Microsoft SharePoint Services.

No matter what platform companies choose, the integrity of the information should be preserved and it should be shared in such a manner that does not compromise other network assets in the company to outsiders. Most application servers and platforms provide basic authentication methods for the user authentication, but are usually limited to passwords, which is a weak authentication mechanism or to certificates that are very difficult to maintain and deploy to your partners.

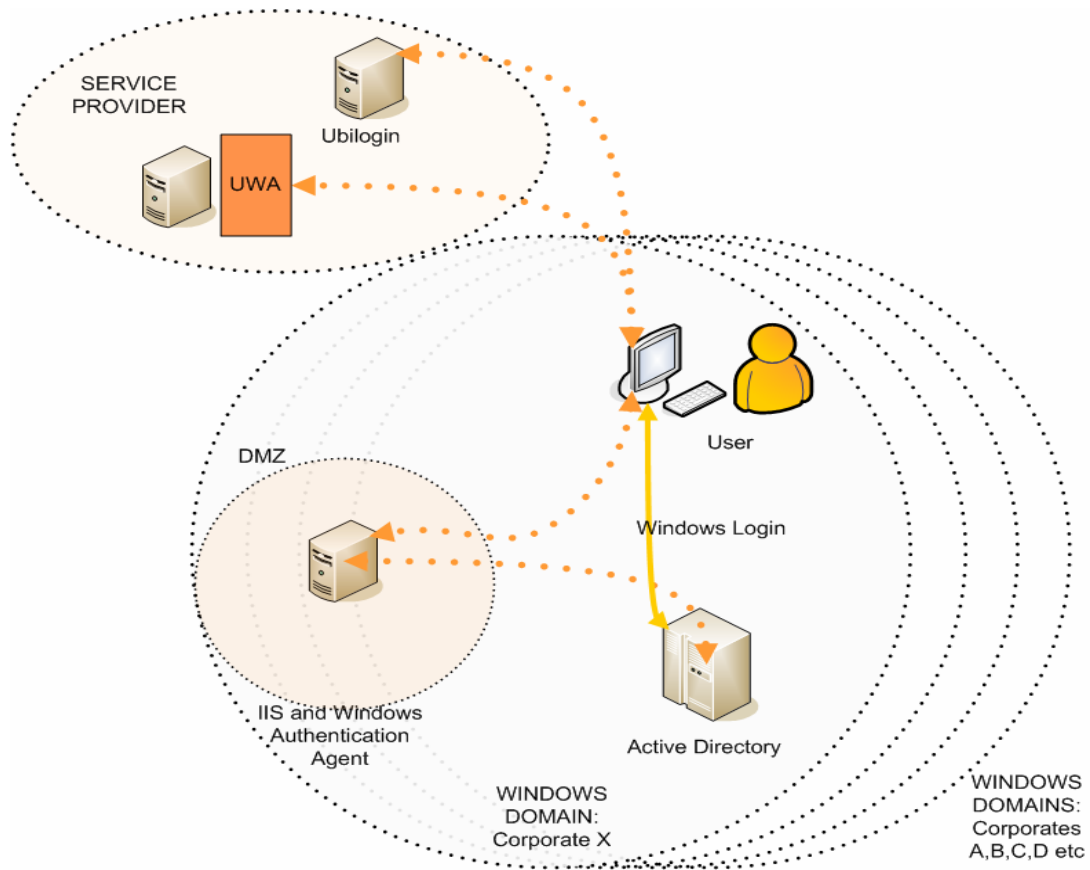

SOLUTION

Ubilogin provides out-of-the-box Federated Windows Domain Single Sign-On. Using Ubilogin it is possible to protect your valuable resources and grant secure access to your partners from their own Windows Domain, providing Single Sign-On for them.

By protecting your services with Ubilogin Web Agents, it is possible to integrate Partner Windows Domains to the authentication and authorization infrastructure and provide federated Windows domain Single Sign-On to any of the application servers and platforms supported by Ubilogin. The integration to the partner network is achieved securely with the Ubilogin Windows Integrated

Authentication Agent, which is installed to the partner network. Windows Authentication Agent takes care of the user authentication to your services, and provides the crucial Single Sign-On services to your partners and customers.

The benefits of providing easy on-line access to your resources are reached using Ubilogin Web Agents. Customers and partners will appreciate the easiness of doing business with your company 24/7 and you have total control on who can access and what as Ubilogin provides flexible authorization policies and over 20 different authentication methods to protect your resources.

BENEFITS

- Secure and simple partner access to your services 24/7
- Single Sign-On to all Web services protected by Ubilogin Web Agents
- Federated Single Sign-On from the partners' Windows domain
- Additional authentication methods for flexible user authentication
- Enhanced productivity through better information availability
- Easy and cost efficient deployment

Ubilogin products enable you to offer Federated Single Sign-On to your partners and customers thus providing secure and simple access to your services 24/7. Single Sign-On from partner Windows Domains provides a distinct competitive advantage over traditional services that require tedious password or certificate based authentication. Federated Single Sign-On reduces your and your partners costs of doing business on-line.
