

Hybrid IAM

Ubisecure enables hybrid cloud + on-premises identity and access management

WHAT IS HYBRID IAM?

A flexible hybrid cloud/on-premises approach to maintain your core user directory on-premises, yet run IAM capabilities (e.g. single sign-on, MFA) from a SaaS infrastructure.

WHEN TO CHOOSE HYBRID IAM?

Organisations choose to deploy a hybrid IAM solution when they are **required to store certain data on-premises (see below), yet wish to leverage the benefits of a cloud IAM solution** – such as fast go-to-market, ease of maintenance and lower TCO.

- **Security** - Some CISO policies dictate strict control over data being stored and processed in the organisation's own data centres, and by their own staff.
- **Regulation** - Organisations (e.g. certain government/financial institutions, or within a geographical area) may be bound to comply with legal storage requirements for on-premises data storage.
- **Legacy systems** - In the case of evolving digitalisation, or mergers and acquisitions, some legacy systems may already be on-prem. Running an

evolutionary hybrid model that connects the various identity sources provides an efficient mechanism to perform initial technical integration.

For organisations with multiple identity sources (on-premises or otherwise), using a cloud IAM deployment as a central brokering/integration point can **simplify integration and deliver substantial savings**.

UBISECURE HYBRID IAM DEPLOYMENTS

Ubisecure is a Europe-based Identity & Access Management (IAM) specialist and offers a comprehensive identity management platform deployed as IDaaS (Identity-as-a-Service), hybrid or on-premises software.

Our flexible IAM platform enables high-assurance, cross-border interactions, with the focus on reducing fraud and avoiding data breaches by successfully converging identity and access security to deliver better user experiences.

With over 20 years' experience, Ubisecure will tailor your IAM solution to best support your business objectives and help simplify your IT environment.

About Ubisecure

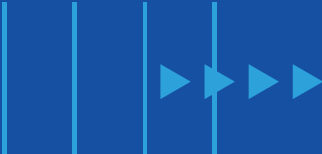

Ubisecure is a Europe-based Identity & Access Management (IAM) specialist and offers a comprehensive identity management platform deployed as IDaaS (Identity-as-a-Service) or on-premises software. The company is also GLEIF-accredited to issue Legal Entity Identifiers (LEI) via its RapidLEI service and has quickly become the global #1 LEI Issuer both in terms of volume and data quality.

As well as managing risk against data breaches, Ubisecure enables Zero Trust to greatly improve the security and experience of how users authenticate, register, access, engage and use the organisation's application, whether it's a web, mobile or a legacy service.

Enterprises use the Identity Platform to quickly implement use cases like single sign-on (SSO), multi-factor authentication (MFA), access management, authorisation and consent policies, advanced identity relationship management, login-as-a-service, and KYC/onboarding.

The platform has native support for a wide range of digital identities to enable real time identity verification and proofing, including Bank IDs, EU eIDs, mobile IDs, enterprise and social identities. Additionally, the RapidLEI service helps banks and FIs to manage and issue large volumes of LEIs to improve organisation-based authentication, meet compliance regulations, and provide better KYC/onboarding experiences for clients.
